

Make up by Martina e-commerce Shop

Create web shop for online selling of make up products. The app should have 3 different pages:

Homepage

Homepage should have a few user-friendly sections for easy navigation:

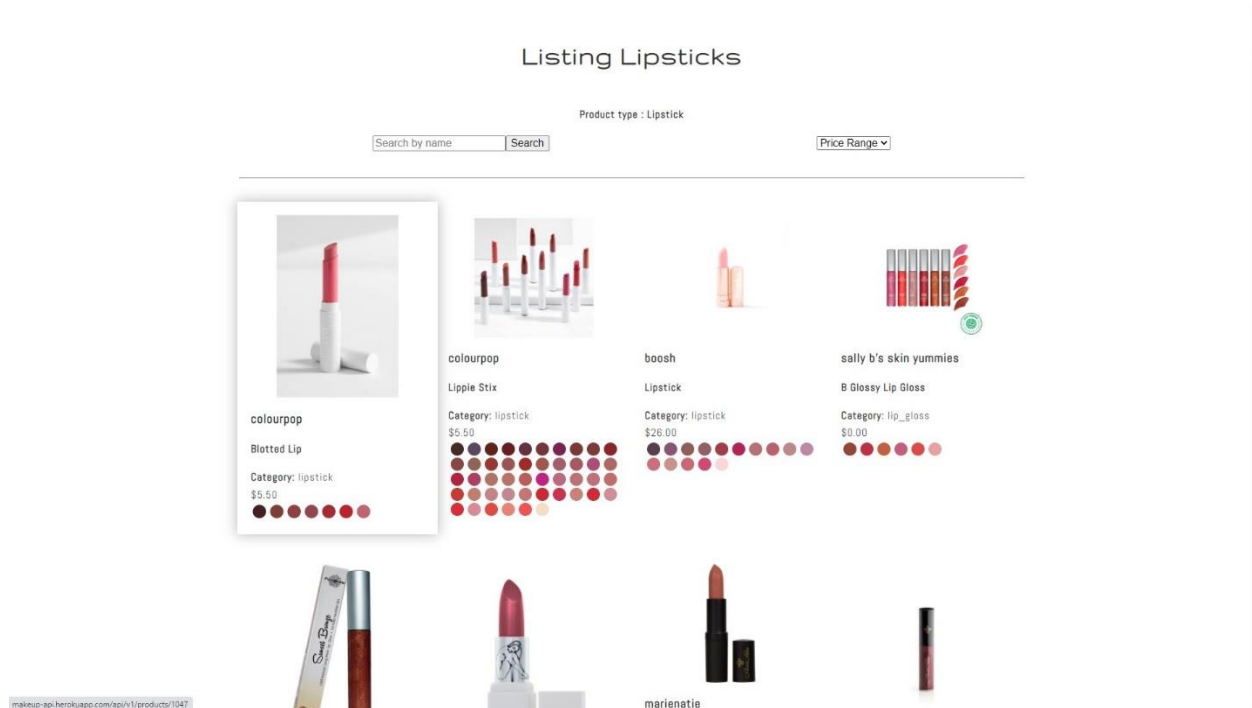

- Simple bootstrap menu with “logo” on the left side and few page links on the right side
- Left sidebar on the main section that lists all the possible make-up categories. By clicking one of the categories, new page should open with all the products listed by the chosen category
- Slideshow with minimum 3 images showing promotional ads (images should be chosen by you and downloaded from internet)
- Featured products content should be a section with 6 products chosen by you displayed into Cards with some basic details for each product. By clicking on the title of one of those products, a new page should open with more details for the selected product. By clicking “Buy” button the user should be navigated to the product original page
- Footer with basic info

Category Page

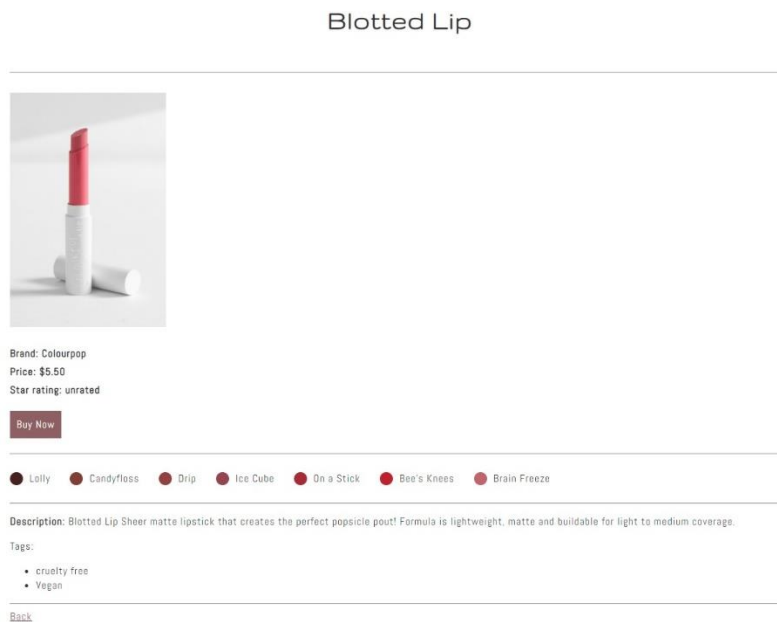

Category Page should open when you chose one of the given categories on the left sidebar of the Homepage. When this page opens there should be displayed all products of the selected category

- Header section should contain Category title and two filters: One for searching by brand name in that category, and other one for filtering by Price
- Main section should show all the products in the selected category into cards with some basic info. If you click on some Product, you should be navigated to Product details page

Product details Page

Product details page should show all the details for the selected product as shown on the screenshot:

***Note: Feel free to improve the given design, because some of the pages are not following Bootstrap standards and components. Be creative 😊**

API use:

For this exercise we will use <http://makeup-api.herokuapp.com/>

- To get list of products by category: http://makeup-api.herokuapp.com/api/v1/products?product_type=lipstick
- To get details about single product: <http://makeup-api.herokuapp.com/api/v1/products/1047.json>
- To get products by brand name you should add product category and brand name: http://makeup-api.herokuapp.com/api/v1/products.json?brand=covergirl&product_type=lipstick
- To get products in a selected category by price range: http://makeup-api.herokuapp.com/api/v1/products.json?price_greater_than=30&price_less_than=40&product_type=lipstick

If you have any questions related to the API use, feel free to ask 😊

Technologies

This app should be build with the following technologies:

- Javascript (use ES6 features as much as you can)
- HTML5 (use semantic HTML)
- CSS3
- Bootstrap

This is the last plain Javascript exercise before taking the React course. Good luck!

With love K.
